FOREST MACHINE TRACKS

2024

Clark Tracks – Built with Pride, Engineered on Experience

Clark Tracks has been manufacturing forest machine tracks in Scotland for over 34 years, earning a strong reputation for delivering high-quality products to the world's largest forestry machinery manufacturers.

Starting in early 2025, all track and chain manufacturing for Nordic Traction Group will be centralized at a single site in Loimaa, Finland.

CUSTOMISATION

Anti-Skid Spikes

Anti-Skid spikes are designed to stop the forest machine sliding sideways when crossing side slopes. They are normally between 40mm and 50mm in height, depending on track model, one spike per plate alternating left and right from track plate to track plate.

Spike Patterns

Track Plate Options

It is often possible for us to increase the overall width of the track by simply increasing the length of the track plate during manufacture. We therefore offer the following track plate options.

- **Extended both sides**
- **Extended more on one side than the other**
Often done where there is little clearance between machine body and tyres.
- **Folded down track plate ends.** It should be noted that this is not always possible.
- **Curved** (standard) or **Flat track plates**

Extra width options are limited by track model and tooling constraints. Please consult our technical department to discuss options and availability.

Asymmetrical widths can be tailored to your needs.

Fitting staple

NEW: Adjustable Haggis Link

TerraX is the first product to feature our revolutionary *Adjustable Haggis Link*, preinstalled in the trackset. This innovation eliminates the need for separate joining links of different sizes when tensioning the track.

Tensioning the track is now quick and simple with our new dedicated tensioner. You can even remove a track plate using only a socket spanner, with no additional tools required.
